Dear Hiring Team,

I am interested in senior software engineering opportunities where I can combine hands-on development with end-to-end technical ownership. Over more than 11 years, I have delivered production software across cloud platforms, enterprise systems, regulated manufacturing, consulting, and customer-facing products.

My background spans Java and Spring Boot, Python, Node.js, React, TypeScript, AWS, APIs, microservices, and SQL databases. I have built event-driven backend services, real-time operational dashboards, serverless applications, and full-stack business workflows. I am comfortable moving from architecture and data modeling through implementation, testing, deployment, observability, and production support.

What I bring is a practical ownership mindset. I adapt quickly to established codebases, turn ambiguous requirements into maintainable solutions, and collaborate effectively with distributed product and engineering teams. I care about clear design, reliable delivery, thoughtful code review, and systems that remain understandable after release.

I also bring recent experience applying AI-assisted workflows and agent-based systems to real business operations, while keeping reliability and deterministic controls at the center of the solution. This complements, rather than replaces, the engineering fundamentals that have guided my work throughout my career.

I would welcome the opportunity to discuss how my experience, technical range, and delivery focus could contribute to your team. Thank you for your time and consideration.

Best regards,

Allan José Rojas Durán
